## Summary of the Results

## CHAPTER I: <br> SIZE AND GEOGRAPHICAL DISTRIBUTION OF THE POPULATION

## 1. Trends in the Population of Japan

The population of Japan is 127.77 million. It increased by $0.7 \%$ over the five-year period, the lowest since the end of World War II.
The 2005 Population Census shows that the total population of Japan as of October 1, 2005 is 127.77 million, which is an increase of 0.84 million or $0.7 \%$ compared with the population reported in the previous Population Census conducted in 2000 ( 126.93 million).
Compared with the figure in 1920, the year in which the first Population Census was conducted, the population of Japan has grown 2.3 times over the past 85 years.
(Table 1.1, Figure 1.1)
Incidentally, the trends in the population from 2000 to 2005 as of October 1 in each year show that the population reported by the Population Census in 2005 is 20 thousand less than 127.79 million, the population estimated in 2004. This is the first time since the end of World War II that the population of the current year as of October 1 has fallen below that of the previous year.

## The live birth rate continues to decline.

According to the observed trends in the live birth rate and the death rate reported in the Vital Statistics of the Ministry of Health, Labour and Welfare, the death rate, which was 25.4 per 1,000 population in 1920, declined significantly after 1920 and remained in the range of 6 from 1966, and then fell to 6.0 in 1979 and 1982. The death rate then went up, and continued to rise reaching 7.4 in 1995, 8.0 in 2003, and 8.6 in 2005 as society ages. Meanwhile, between 1947 and 1949, the live birth rate rose back to the level recorded in 1924 to 1928 of 33 to 34 births per 1,000 population, thanks to the first baby boom, but dropped sharply in 1950 to 1954, leveling off to around 17 and 18 between 1955 and 1970. The second baby boom from 1971 to 1974 pushed the live birth rate up to the 19 range, but the rate then showed a downtrend, dropping to 8.4 in 2005, which is the first time that the live birth rate has dropped below the death rate since the start of the statistics.
(Table 1.2, Figure 1.1)

1) The figures for 1915 and before refer to the estimated population as of January 1 of the respective years by the Statistics Bureau of the Cabinet. Those for 1920 and thereafter refer to the population as of October 1. The figure for 1945, however, is as of November 1.
2) The population as corrected by subtracting 1,181 thousand, which is the estimated number of military and civilian personnel, etc. outside of Japan, from 73,114 thousand, which is the population reported in the Population Census.
3) The population count as corrected by adding 149 thousand, which is the estimated number of military personnel and foreign residents, to 71,998 thousand, which is the population reported in the 1945 Population Survey. Excludes Okinawa-ken.
4) Population increase over the three-year period.
5) Excludes Okinawa-ken.

2. Japan's Population from a Worldwide Perspective

The population of Japan ranks tenth in the world, dropping in rank.
The United Nations estimates that the world population is 6.515 billion as of mid-2005, of which the total population of Japan accounts for $2.0 \%$. According to the population of the respective countries reported in the U.N. estimates, China is the most populous country with 1.313 billion people, followed by India ( 1.134 billion), the United States ( 300 million), Indonesia (226 million), Brazil (187 million), Pakistan (158 million), Bangladesh (153 million), Russia ( 144 million), and Nigeria (141 million), next to which comes Japan, ranking tenth.

## CHAPTER II: POPULATION BY SEX AND AGE

## 1. Sex Ratio in Population

Men and women match in number around the age of 50.
Observing the population of Japan by sex as of October 1, 2005, the male population is 62.35 million and the female population is 65.42 million, revealing that women outnumber men by 3.07 million, bringing the sex ratio in population (the number of men for every 100 women) to 95.3.
According to observations on the sex ratio in population by five-year groups in 2005, the sex ratio is around 105 in every group for people under 20, but declines in groups for people aged 20 and over as age advances, and drops below 100 in every group for people aged 50 and over. This is because boys are born in greater number than girls with a live birth rate difference of 5 to $6 \%$, and that men's death rate is higher than women's death rate in any age group, with the difference in death rate between the sexes widening as age advances.
(Table 2.1 and 2.2, Figure 2.1)

Figure 2.1 Sex Ratio in Population by Age (Five-Year Groups): 2005
(Males per 100 females)

## Sex ratios are low in Europe and are high in Asia.

Examining the sex ratios in population in other countries, the sex ratios are low in European countries and are high in Asian countries. Among European countries, Ukraine and Russia show particularly low figures of 85.8 and 86.6 , respectively, and Poland (93.6), Portugal (93.6), Italy (94.4), etc. also show low sex ratios. Among Asian countries, Saudi Arabia has a particularly high figure of 123.5, and India (107.5), Afghanistan (107.5), China (106.8), Pakistan (106.0), etc. also have high sex ratios. Meanwhile, Japan’s sex ratio, which is equal to that of Thailand, is at the lowest level in Asia (95.3).

## 2. Population Pyramid

## Gourd-shaped population pyramid

The change in age composition in the population of Japan is clearly reflected in the changing shape of its population pyramid.
Until the post-World War II year of 1950, the population pyramid of Japan was shaped like Mt. Fuji, with a broad base of younger people in the population in those days. The live birth rate then started to drop sharply after 1950, with the population pyramid becoming pot-shaped in 1960, which indicates a population decline. Afterward, due to a gradual rise in the live birth rate from 1962 to 1973, the base of the population pyramid widened, turning the pyramid into a star-shaped. Marking its peak in 1973, the live birth rate then declined again, and the population pyramid became gourd-shaped with two bulging portions.
Regarding the population pyramids of other countries, that of the United States is bell-shaped with a hollow that represents young age groups, and that of Italy is pot-shaped, reflecting a decrease in the child population due to the declining live birth rate. The population pyramid of the United Kingdom is somewhere between the above two shapes. The population pyramid of India is similar to Mt. Fuji in shape, although the live birth rate of the country has been falling in recent years.
(Figure 2.2)

Figure 2.2 Population Pyramids of Japan and Other Countries

Source: United Nations, World Population Prospects, The 2006 Revision. For Japan, based on the Population Census.

## 3. Population by Three Age Groups

## The aged population is approximately 1.5 times the child population.

Regarding the population distribution among three age groups in Japan in 2005, the population aged 0 to 14 (child population) is 17.52 million, the population aged 15 to 64 (productive-age population) is 84.09 million, and the population aged 65 and over (aged population) is 25.67 million, accounting for $13.7 \%, 65.8 \%$, and $20.1 \%$ of the total population, respectively. Comparing these figures with those from 2000 demonstrates that the child population has decreased by 0.95 million ( $5.1 \%$ ) and so has the productive-age population by 2.13 million ( $2.5 \%$ ) while, in contrast, the aged population has increased by 3.67 million (16.7\%). As a result, the aged population now greatly exceeds the child population, by a factor of 1.5 times. Observing the proportion of population between the three age groups, both the child population and productive-age population have dropped while the aged population has climbed.
It is estimated that the proportion of the aged population to the total population will continue to increase, reaching $29.2 \%$ by 2020 and $39.6 \%$ by 2050. (Tables 2.4, 2.5 and 2.6, Figure 2.3)

## The proportion of the child population is $\mathbf{1 3 . 7 \%}$.

The child population was 29.79 million, accounting for $35.4 \%$ of the total population, in 1950, the year immediately after the first baby boom, but dropped to $24.0 \%$ in 1970. Afterward, a surge in child births during the second baby boom pushed up the proportion of the child population to $24.3 \%$ in 1975 . Since 1980, however, the proportion of the child population has continued to fall due to the decreasing live birth rate, etc., shrinking to $14.6 \%$ in 2000 , and to $13.7 \%$ in 2005.

## CHAPTER III: MARITAL STATUS

## 1. Proportion by Marital Status

## The never-married rate is high among men.

According to the population aged 15 years of age and over ( 53.09 million men and 56.68 million women) by marital status that is reported in the 2005 Population Census, the number of married men is 32.26 million and that of married women is 32.32 million, accounting for $60.8 \%$ and $57.0 \%$ of the population aged 15 years of age and over, respectively (married rate). The proportion of the never-married population (never-married rate) is $31.4 \%$ among men and $23.2 \%$ among women, showing a higher rate among men. This is mainly because the age at which men first marry is higher than that of women, leading to a large proportion of never-married younger men.
(Table 3.1)

## Divorce rate is rising in both men and women while never-married rate and married rate are falling.

The trends in the proportion of the population 15 years of age and over by marital status indicate that in both men and women, the never-married rate started declining in 2000 and so did the married rate from 1985 as the widowed rate, which had leveled off in recent years, started rising again in 1995. The divorce rate showed little fluctuation until 1975, but started rising in 1980 in both men and women as a result of an increase in divorce cases in recent years.
In the proportion by marital status that is standardized on the assumption that the age composition of the population of Japan for each year is the same as that of 2005, in both men and women, the never-married rate and divorce rate show an upward trend, while the married rate and widowed rate show a downward trend.
(Tables 3.1 and 3.2, Figure 3.1)

1) Total of "Widowed" and "Divorced".

Note: The calculation for the standardization was conducted by considering the nationwide population 15 years of age and over by sex and age (five-year groups) as of 2005 to be standard population. In short, the purpose of calculation is to observe how the proportions by marital status would change if the age composition of the population 15 years of age and over is assumed to be identical to that of 2005.

Table 3.2 Trends in the Number of Marriages and Divorces: 1950 to 2005

## CHAPTER IV: LABOUR FORCE STATUS

## 1. Trends in the Population in Labour Force

## Japan's population in labour force is $\mathbf{6 5 . 4 0}$ million, showing a labour force participation rate of $61.5 \%$.

According to the status of economic activities of the population 15 years of age and over reported in the 2005 Population Census, out of 109.76 million aged 15 years and over, 61.51 million are employed and 3.89 million are unemployed. The labour force consisting of the employed and the unemployed is, therefore, 65.40 million, which is a labour force participation rate of $61.5 \%$ (proportion of the population in labour force among the population 15 years of age and over, excluding "labour force status not reported"). Examining these figures by sex gives a male labour force of 38.29 million, or male labour participation rate of $75.3 \%$, and female labour force of 27.11 million, or female labour participation rate of $48.8 \%$.
(Tables 4.1 and 4.2)

## Labour force declined by $\mathbf{1 . 1 \%}$.

Comparing the population in labour force in 2005 with that in 2000 shows that the labour force shrank by 0.7 million or 1.1\% from 2000 to 2005.
Japan's labour force increased by over 4 million in every five-year period during the high-growth period from 1955 to 1970, with a high increase rate in each five-year period of 9 to $10 \%$. This growth had slowed by 1975 in the wake of the economic slump triggered by the oil crisis in 1973: from 1970 to 1975 the labour force increased by only 1.07 million or $2.0 \%$. From 1980, the labour force increased by 2.84 to 3.42 million, or around $5 \%$, in every five-year period, but decreased in 2000 for the first time since the end of World War II, and the downtrend has continued to 2005.
(Table 4.3)

2) The figures for Okinawa-ken for 1955 refer to the population 14 years of age and over based on the results of sample tabulation.

## 2. Labour Force Participation Rate by Sex and Age Group

## The labour force participation rate among men is in a downtrend.

From 2000 to 2005, the population not in labour force increased while the labour force decreased, reducing the labour force participation rate from $62.1 \%$ to $61.5 \%$, or a 0.6 point drop. Examining the labour force participation rate by sex indicates that the rate among men decreased from $76.5 \%$ in 2000 to $75.3 \%$ in 2005 , or a 1.2 point drop, whereas the rate among women remained almost flat, changing from $48.7 \%$ to $48.8 \%$ in the same period. In the long view, the labour force participation rate among men has been in a downtrend steadily, from $84.3 \%$ in 1970. Among women, the rate continued to rise, from $46.1 \%$ in 1975, but then started to fall slightly after reaching 49.3\% in 1995.
(Table 4.4)

## The labour force participation rate among women is rising in respective age groups among people 25 to 64 years old.

Comparing the labour force participation rate by age group in 2005 with that in 2000 reveals that in men, the rate among the 60 to 64 year-old age group rose by 2.1 points, and the rate among the age group of 65 and over dropped by 2.1 points. In general, however, each age group in men shows no big change in the labour force participation rate. Among women, the labour force participation rate dropped in the age group of 20 to 24 years old and of 65 and over, while it rose in respective age groups among people 25 to 64 years old. In particular, the rate among the 30 to 34 year-old age group went up from $57.6 \%$ in 2000 to $63.4 \%$ in 2005, a 5.8 point rise, and the rate among the 25 to 29 year-old group went up from $70.7 \%$ in 2000 to $74.9 \%$ in 2005, a 4.2 point rise. This has lifted the bottom of the M -shaped curve.

## CHAPTER V:

## INDUSTRIAL COMPOSITION OF EMPLOYED PERSONS

## 1. Trends in the Distribution of Employed Persons among Three industrial Groups

## Employed persons in the secondary industry are declining sharply.

Regarding the distribution of the total of 61.51 million employed persons 15 years of age and over among the three industrial groups in 2005, employed persons in the primary industry consisting of agriculture, forestry and fisheries numbers 2.97 million, those in the secondary industry consisting of mining, construction and manufacturing numbers 16.07 million, and those in the tertiary industry consisting of transport, wholesale and retail trade, and finance and insurance, etc. numbers 41.33 million. The proportions of employed persons in the three industrial groups are $4.8 \%, 26.1 \%$, and $67.2 \%$, respectively.
(Table 5.1)
The proportion of employed persons in the tertiary industry is rising.
According to the trends in the proportion of employed persons by industry, in 1920 when the first Population Census was conducted, the primary industry accounted for $53.8 \%$, the secondary industry for $20.5 \%$, and the tertiary industry for $23.7 \%$, showing the dominance of the primary industry. In the post-World War II year of 1950, the primary industry accounted for $48.5 \%$, the secondary industry for $21.8 \%$, and the tertiary industry for $29.6 \%$. The industrial composition then shifted with high economic growth, and the proportion of employed persons in the tertiary industry kept rising, surpassing $50 \%$ to $51.8 \%$ in 1975 , $64.3 \%$ in 2000, and $67.2 \%$ in 2005.

1) Includes "Establishments not adequately described".
2) Gainful workers of all ages.
3) Gainful workers of all ages excluding military personnel and foreigners who have other nationality than Korea, Taiwan, Karafuto and Nanyo-gunto.
4) Employed persons 14 years of age and over. Excludes Japanese in Okinawa-ken who have legal residence in mainland Japan and foreigners in Okinawa-ken.
5) The figures for Okinawa-ken are employed persons 14 years of age and over based on the results of sample tabulation.

## CHAPTER VI: OCCUPATIONAL COMPOSITION OF EMPLOYED PERSONS

## 1. Occupational Composition and Its Trends by Four Groups of Occupation

## Employed persons are decreasing in three occupational groups excluding 'sales and service occupations'.

Regarding the distribution of the total of 61.51 million employed persons 15 years of age and over by four groups of occupation as of 2005, there are 2.94 million employed persons in 'agriculture, forestry and fishery occupations', 19.50 million in 'production and transport occupations', 16.13 million in 'sales and service occupations', and 21.83 million in 'clerical, technical, and managerial occupations'.
(Table 6.1)
The proportion of 'clerical, technical, and managerial occupations' is highest.
According to the proportion of employed persons 15 years of age and over by the four groups of occupation, the highest proportion is in 'clerical, technical, and managerial occupations' at $35.5 \%$, followed by 'production and transport occupations' with $31.7 \%$, 'sales and service occupations' with $26.2 \%$, and 'agriculture, forestry and fishery occupations' with $4.8 \%$.
Regarding the trends in the proportion among the four occupational groups, in 1960, 'production and transport occupations' accounted for $32.9 \%$ and 'agriculture, forestry and fishery occupations' for $32.5 \%$, each accounting for approximately one third of all occupations, and 'clerical, technical, and managerial occupations' accounted for $17.4 \%$ and 'sales and service occupations' for $17.1 \%$. Thereafter, the proportion of 'agriculture, forestry and fishery occupations' dropped substantially. The proportion of 'production and transport occupations' continued rising till 1970, but declined thereafter. Meanwhile, the proportion in 'clerical, technical and managerial occupations' surpassed that in 'production and transport occupations' from 1955 to become the largest occupational group. The proportion in 'sales and service occupations' has also been rising.
(Table 6.2, Figure 6.1)

## CHAPTER VII: POPULATION OF FOREIGN RESIDENTS

1. Trends in the Population of Foreign Residents and Their Nationalities

The population of foreign residents is $\mathbf{1 . 5 6}$ million, a $\mathbf{1 8 . 7 \%}$ increase.
The 2005 Population Census shows that the population of foreign residents usually living in Japan is 1.56 million ( $1.2 \%$ of the total population), which is an increase of 245 thousand or $18.7 \%$ from the population of foreign residents in 2000.
Trends in the population of foreign residents reported in respective Population Censuses conducted since 1920 (the census covered all foreigners in Japan before 1940, and covered the same groups of foreigners as the census in 2005 after 1950) indicate that the population of foreigners residing in Japan has been increasing rapidly.
(Table 7.1)
The nationalities of foreigners usually living in Japan are becoming more diverse.
According to the population of foreign residents in 2005 by nationality, Korean nationals number 473 thousand to constitute the biggest group, followed by Chinese nationals (353 thousand), Brazilian nationals (215 thousand), Philippine nationals (126 thousand), etc.
A comparison of the population of foreign residents by nationality in 2005 with that in 2000 reveals that the numbers of Korean and United States nationals decreased by $10.7 \%$ and $0.6 \%$, respectively, while the numbers of Chinese, Brazilian, Philippine and Peruvian nationals increased significantly by $39.6 \%, 14.4 \%, 35.0 \%$ and $20.3 \%$, respectively. This indicates that nationalities are diversifying as the foreign population increases.
(Table 7.2)
Table 7.1 Trends in the Total Population and the Number of Foreigners : 1920 to 2005

| Year | Total population (thousands) | Number of foreigners (thousands) |  |  | Sex ratio of foreigners | Proportion of foreigners (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

1) Excluding Okinawa-ken.
2) Based on the results of $20 \%$ sample tabulation.
3) Based on the results of special tabulation on foreigners.
4) Including "statelessness and name of country not reported".
5) Including Koreans living in Okinawa-ken.

## 2. Foreign Residents by Sex and Age

The sex ratio in population by foreign residents is 87.7 , and varies greatly by nationality. Regarding the population of foreign residents by sex, the male population is 727 thousand while the female population is 829 thousand, showing that female foreigners outnumber male foreigners by 102 thousand with a sex ratio of 87.7 . This ratio is 7.6 points lower that of the Japanese population of 95.2, and varies greatly by nationality.
(Tables 7.1 and 7.3)
The proportion of the productive-age population is high among foreigners of Southeast
Asian nationalities.
According to the proportions within the population of foreign residents among three age groups by nationality, the proportion of the productive-age population is above $90 \%$ among Indonesian, Thai, Philippine and Chinese nationals, and is $89.8 \%$, a figure close to $90 \%$, among United Kingdom nationals. The proportion of the child population is high among Peruvian (20.0\%), Brazilian (16.5\%), and Vietnamese (14.7\%) nationals, while the aged population is high among Korean nationals (15.2\%).
