

# Statistical Tables

## Notes regarding Statistical Tables

- 1 The figures are estimated by multiplying the reciprocal of the sampling fraction according to the 2009 Economic Census for Business Frame. The figures for establishments, enterprises, and other entities that had not submitted the questionnaire by the due date are estimated based on the Economic Census, disclosure information, and other data sources. Demand Situation, however, are not estimated by multiplying the reciprocal of the sampling fraction. As for Demand Situation, the figures for enterprises are totalized by business activity and for establishments by the unit of establishment.
- 2 This survey is a sampling survey, so that the sampling error is included in the sales, and persons working at the location of establishment.
- 3 Because the survey was reviewed in January 2013, time series comparison of actual figures requires attention.
- 4 The sums of its components does not necessarily add up to the total, since the figures are rounded to the unit (the number of persons working at the location of establishment is rounded to the nearest hundred since January 2013).
- 5 The method of calculating "Change over the year" is as follows.  
$$[\text{Change over the year (\%)}] = \{([\text{Pertinent month value of this year}] - [\text{Pertinent month value of the previous year}]) / [\text{Pertinent month value of the previous year}]\} * 100$$

In order to make it possible to compare values of the period before review and after, change over the year of 2013 are calculated by using adjusted pertinent month value of the previous year (2012).
- 6 The quarterly and annual averages are the arithmetic mean of the monthly figures.
- 7 "-" denotes that there are no applicable figures.
