(References)

- ‘Impact of weight change’ is the impact of the revision of the weight reference period on inflation rates and contributions. When the weight of an item becomes smaller than before, the absolute value of the contribution becomes smaller, too: when the weight becomes larger, the absolute value of the contributions becomes larger.
- ‘Impact of index reset’ is the impact of the revision of the index reference period. When the index value becomes lower after the base revision, the absolute value of the contribution becomes smaller: when the index value becomes higher, the absolute value of the contribution becomes larger.
- The other factors are such as revision for calculation models and weights on inner-item in ‘model-based estimation’ items, add/remove of items, etc.

- The impacts of the base revision are differ from each item and each month. For instance, contribution differences between 2015-base and 2010-base on TV sets index are as follows.
