3 National Accounts

This chapter contains National Accounts, Prefectural Accounts and Input-Output Tables.

System of National Accounts (Fundamental Statistics) The System of National Accounts is compiled by the Economic and Social Research Institute of Cabinet Office based on compilation rules and methods in conformity with the international standard (SNA) adopted by the United Nations, with the aim to record systematically the whole economy of our country as well as to be able to make international comparisons. The Japanese National Accounts (JSNA) had been compiled based on the 1993 SNA (adopted by the United Nations in 1993) since 2000. The 2008 SNA (the latest international standard adopted by the United Nations in 2009) was introduced in 2016.

Based on the 1993 SNA, the 2008 SNA includes the clarification of various concepts and recording methods, the introduction of "intellectual property products" that expand the scope of existing intangible fixed assets to include "research and development (R&D)," the recording of "employee stock options" in employee compensation and financial assets, and the thorough recording of pension systems based on employment relationships on an accrual basis (over 60 changes and clarifications from the 1993 SNA).

At the end of 2025, the "2020 Base Revision" incorporating the "2020 Input-Output Tables" was implemented. Building upon the "Basic Plan for the Development of Official Statistics" (Cabinet decision in March 2023), measures were implemented including the introduction of output-type construction deflators and other adjustments.

The National Accounts are presented by Quarterly Estimates of GDP and by Annual Report on National Accounts. In the annual compilation of JSNA, the figures for the latest year (both fiscal and calendar) are estimated as "First Annual Estimates", while the figures for the previous year (both fiscal and calendar) are estimated reflecting newly available source data as "Second Annual Estimates". In addition, the figures for a year after Second Annual Estimates (both fiscal and calendar) are re-estimated as "Third Annual estimates" through the balancing process between production side and expenditure side under the framework of Supply-Use Table (SUT). The quinquennial large-scale source statistics, such as the input-output tables and the Population Census are reflected, and the base year is changed almost every five years and all former estimates are revised retroactively. The National Accounts based on the 2008 SNA is, as was for the 1993 SNA, broadly divided into a flow chapter and a stock chapter, which is further grouped into various accounts tables (Integrated and by Institutional Sectors), main time-series (flow), supporting tables and supplementary tables (stock) for a clear presentation.

Regarding the accounts, the integrated accounts are the accounts when the entire Japanese economy is viewed as one economic unit. The integrated flow account is to record the flow of commodities (goods and services) and money (income, financial assets and liabilities) to illustrate the whole national economic activities in a given period of time. The Chart of Accounts includes the Gross Domestic Product Account, the National Disposable Income and Use Account, Capital and Financial Accounts, and Rest of the world Accounts. On the other hand, the integrated account of stock shows the amount of assets and liabilities of the whole national economy at a given point of time. If we add the capital and financial accounts, which represent capital transactions during the period, and the adjustment account, which represents revaluation due to price changes, etc. to the opening balance sheet account, it will match the ending balance sheet account.

The institutional sector classification is a classification of organisations which are responsible for decision-making on the receipt and disposal of income, the procurement of funds, and the use of assets, and there are such sectors as

non-financial corporations, financial corporations, general governments, households (including private unincorporated enterprises), and private non-profit institutions serving households. Moreover, there is the economic activities sector classification, which classifies bodies responsible for decision-making on the production of goods and services.

Prefectural Accounts The Prefectural Account main aims to clarify the circulation and the structure of the economy of the prefectures (hereinafter refers to Prefecture) by recording 3 such aspects as production, distribution and expenditure, and conditions of the economy of prefecture resident comprehensively, as well as contributing to policy management as a synthetic economic indicator of the prefectural economy, and to provide the basis for decision making of household and company. In addition, it ascertain the standing of each prefectural economy in the national economy, and to make it possible to analyze the regional analysis of national economy by means of comparison of each prefectural economy. Prefectural Accounts are published by all prefectures based on the Standard Method for Prefectural Accounts, which was formulated by the Economic and Social Research Institute of the Cabinet Office in accordance with the National Accounts. In addition, Civic Economic Accounts are prepared and published by 16 ordinance-designated cities (Sapporo, Sendai, Chiba, Yokohama, Kawasaki, Niigata, Hamamatsu, Nagoya, Kyoto, Osaka, Sakai, Kobe, Okayama, Hiroshima, Kitakyushu, and Fukuoka). The Institute collects all the latest prefectural accounts and this chapter uses them. Prefectural Accounts of fiscal 2022 are based on the "Prefectural Accounts standard methods (the 2015 edition of benchmark year)" in conformity with the national account (2008 SNA, Benchmark year = 2015).

Although the Prefectural Accounts are prepared by each prefecture based on the "Prefectural Accounts Standard Method", the estimation method is not necessarily the same for all prefectures due to the state of preparation of basic data and differences in the development stage of estimation. It is necessary to keep this point in mind when comparing figures among prefectures.

Input-Output Tables (Fundamental Statistics) The Input-Output Tables aims to clarify systematically the economic structures in our country, and to provide the basic information to analyse economic ripple effect and to revise the benchmark of each economic indicators. The tables are compiled every five years, for which the Ministry of Internal Affairs and Communications, the Cabinet Office, the Financial Services Agency, the Ministry of Finance, the Ministry of Education, Culture, Sports, Science and Technology, the Ministry of Health, Labour and Welfare, the Ministry of Agriculture, Forestry and Fisheries, the Ministry of Economy, Trade and Industry, the Ministry of Land, Infrastructure, Transport and Tourism and the Ministry of the Environment works together. The latest Input-Output Tables are the 2020 Input-Output Tables, which cover production activities and transactions carried out in Japan during the one-year period from January to December 2020. In principle, the "accrual principle" is used to record the point in time when production activities and transactions were actually carried out.

The Input-Output Table shows, in a matrix format, inter-industry transactions of goods and services in the national economy for a certain period (usually one year). Columns (vertical) show the breakdown of payments (cost composition) for raw materials, fuel, labor, etc. used in the production of goods and services and are called "inputs". Rows (horizontal) show the breakdown of destinations (sales channel composition) for the goods and services produced and are called "outputs". Since it shows the composition of inputs and outputs of goods and services in this way, it is also called an "input-output table." Both “input value” and “output value” are terms with the breakdown of each endogenous sector (intermediate demand sector and intermediate input sector) in mind. Regardless of whether the sector is endogenous or exogenous (final demand sector and gross value added sector), the vertical breakdown of the column sector is called the "input", and the horizontal breakdown of the row sector is called the "output". An Input-Output Table is a processing

statistic created using various information such as the transaction status between all industries. As such, the Input-Output Table has the following characteristics.

(1) Comprehensive understanding of Japan's economic structure is possible.

(2) By compiling various primary statistics with different purposes into an Input-Output Table, inter-industry interrelationships and various comparisons that cannot be seen by simply comparing primary statistics alone become possible.

The main constituent of the Input-Output Tables are the basic transaction table, input coefficient table, and inverse matrix coefficient table. The basic transaction table shows matrix representations of the values of goods and services transacted between industries, etc. or between industry and final demand (households, etc.), while the input coefficient table is obtained by dividing the value of raw materials inputted, etc. for each industry in a column of the basic transaction table by the value of production of the industry columns, indicating the quantity of raw materials, etc. necessary for the production of one unit in each industry. The inverse matrix coefficient tables show the ripple effect produced directly or indirectly by one unit of final demand in a certain industry on the production of each industrial sector. While the transaction table is by itself able to make clear the structure of industries, the most important use is the input-output coefficient, the inverse matrix coefficient, and the end-demand product-specific production inducement coefficient are used to predict the economy, measure the effects of specific economic policies, or perform price analysis.

In the Input-Output Tables for 2020, for endogenous sector, basic transaction tables for basic classifications (445 rows by 391 columns), various coefficient tables for integrated minor classifications (188 sectors), and various supplementary tables. However, presented in this chapter are the transaction table and the input coefficient table which are based on the aggregated classification of 13 by 13 sectors. In addition, the units in the table of statistics were reviewed, and the unit of 1 million was changed to 100 million (1 billion table, with the first decimal place).

See the Glossary for Terms in this chapter.
