^{*} Excluding 'Not Reported' Industry and/or Employment Status.

2.5 OCCUPATION

An occupation refers to a kind of work done during the reference period (twelve months preceding the census) by the person employed. The occupational code used in the Cambodia General Population Census 2008 is the latest ISCO – ISCO08. The Census 1998 applied the old version of ISCO – ISCO88 to classify occupations. The difference between ISCO88 and ISCO08 is too large to ignore. Therefore, it is difficult to

synthesize for comparison. Therefore, this report does not compare occupational data between the two censuses.

2.5.1 Major Group of Occupation in 2008

Based on 10 major groups of occupation, about 71 percent of the total employed persons who aged 5 and over, about 73.6 percent of employed females and 67.5 percent of employed males are working as a 'Skilled agricultural, forestry and fishery workers'. 'Service and sales workers' is the second occupation which hold the most persons engaged in (about 9 percent). The categories of 'Craft and related workers' and 'Elementary occupations' account for 7.2 percent and 4.6 percent, respectively. (Table 2.22)

'Professionals', 'Technicians', and 'Managers', etc. account for very small proportions among the employed population. Females have higher proportions in 'Skilled agricultural, forestry and fishery workers', 'Services and sales workers' and 'Craft and related workers' than males, whereas, the proportion of employed males working as managers, technicians, plant and machine operators and assemblers, etc are twice as high as that of female counterparts.

As previously described, the industrial distribution of employed population has great difference between urban and rural areas. The difference in industrial structure directly affects the occupational structure. As a result, the occupational structure has great difference between urban and rural areas.

The majority of employed population are engaged in agricultural industry. The proportion of people working as 'Skilled agricultural workers' is 83.2 percent in rural areas. The second occupation in which the most persons participated in rural areas is 'Service and sales workers' but that proportion is only 4.6 percent. Males and Females show similar proportional distribution of 10 occupational categories.

The industrial structure in urban areas has much more variety than that in rural areas. But the variety in occupation is not so large and there are three leading occupations in urban areas. Those occupations are 'Services and sales workers' (28.9 percent), 'Skilled agricultural, forestry and fishery workers' (13.0 percent) and 'Craft and related workers' (22.0 percent).

The leading occupation for males is the same as one for females, but females tend to be concentrated on the above three occupations. Male occupations are more diverse than female ones. The categories of 'Plant and machine operators and assembler' and 'Elementary occupation' are the occupation in which primarily males are engaged. (Figure 2.14)
